Category:Educational research Category:Metadata[Effect of selecting female and male bank vole males and females at random for crossing to investigate the genetic characteristics of early differentiation]. In a population of bank vole (*Clethrionomys glareolus*, Muridae) females and males were selected at random to be parents in the mating procedure. The total amount of gene pool of the bank vole population was investigated. It was assumed that in the population female and male relatives are crossed with each other with a substantial possibility, because there are cases when females are mated with males from the own group. On the other hand, in random mating and sib-mating the amount of genetic differences is higher and the difference disappears or decreases. Our study revealed that when the overall correlation coefficient is estimated as 0.27, the maximum probability of estimating identical genes in offspring is 35.91%, as well as by sib-mating the total amount of gene pool is 0.50-0.55. The empirical correlation coefficient was lower when estimated separately for the groups of domestic and wild males, wild females and the domestics as compared with the total correlation coefficient.Q: Android start Splash Activity on Button Click I wanted to run a Splash Screen when the app opens and then direct it to my main activity on button click. I have the following code for this process but it is not working. public void onCreate(Bundle savedInstanceState) { super.onCreate(savedInstanceState); setContentView(R.layout.splash); myButton.setOnClickListener(new OnClickListener() { @Override public void onClick(View v) { Intent myIntent = new Intent(Splash.this, Login.class); startActivity(myIntent); finish(); } }); requestWindowFeature(Window.FEATURE_NO_TITLE); Thread thread = new Thread() { public void run() { try {

Early predictive values for ventricular fibrillation (VF) are lacking in post-cardiac arrest patients. This study aimed to describe the early predictive values of VF for poor neurological outcome. We studied 141 post-cardiac arrest patients who received VF in- or outside a hospital. Poor neurological outcome (PONO) was defined as a Glasgow Outcome Scale-Extended score of 2 or less. Predictive values of six variables for VF were assessed. The six variables were as follows: age, initial monitored value of the electroencephalogram, initial systolic blood pressure, initial rhythm, serum level of blood glucose and emergency medical services arrival time. Fifteen of the 141 patients survived with good neurological outcome, and 126 of the 141 patients had PONO. The overall sensitivity and specificity of these six variables for predicting VF were 88.9% (95% confidence interval [CI], 79.4-95.1%) and 86.5% (95% CI, 74.1-93.9%), respectively. The overall positive and negative predictive values for poor neurological outcome were 51.8% (95% CI, 40.5-63.3%) and 98.5% (95% CI, 94.1-99.6%), respectively.

The positive and negative predictive values for VF for poor neurological outcome were 61.9% (95% CI, 46.8-75.7%) and 93.6% (95% CI, 89.7-96.0%), respectively. All six variables showed poor predictive value for the detection of VF. Most importantly, high initial serum blood glucose levels had a negative predictive value of 93.9% (95% CI, 89.5-96.0%). 2 × 50 µL reactions, including 10 µL of 1 × PCR Master Mix, 5.0 µL of each primer (10 µM), 0.4 µL of probe (10 µM), 1.0 µL of template DNA, and 0.4 µL of biotin.
