To investigate how physical capacity and diet are associated with the 2-year mortality rate in

---

individuals with chronic obstructive pulmonary disease. We evaluated 4,780 patients with chronic obstructive pulmonary disease (aged 44 +/- 13 years) from a primary care network in Porto, Portugal. Patients had exercise tests (cycle ergometer or 6-minute walking test), blood determinations, were divided according to sex, and followed up for 2 years for mortality (n = 1,047 deaths). The main predictors of mortality were body mass index, FEV1, 6-minute walking distance, and diet (percentage of calories from macronutrients). During follow-up, 65.2% of patients were classified as high risk for mortality, with a hazard ratio of 4.29 (95% confidence interval, 3.94-4.67; P c6a93da74d
